## ATEX - Habonim Statement

---

Note to Customers,

In our previous certification a Specific Conditions of Use was put on the pneumatic actuators C15 – C100 series.

*All springs return actuators models shall have a Namur breather block or alternative they shall be fitted with a solenoid valve that comprises a breather; the separately certified solenoid valve shall be fitted a port A and B shown on the manufacturer's drawings and instruction manual. When a solenoid valve is used in place of a breather, it shall replicate a breather in terms of preventing an internal potentially explosive atmosphere and shall meet the requirements listed in the conditions of use (ii), as listed.*

This requirement has now been removed from the actuators as we can demonstrate via testing that our springs in the actuators are good for at least 375,000 cycles (750,000 strokes) before replacing.

Please see new CEMA certificates,  
If required, certifications from the previous years can be supplied per demand.

Sincerely,

Habonim Engineering Department.
